

Project Overview

Project Description:

This is an Online Movie Store, which allows the user to:

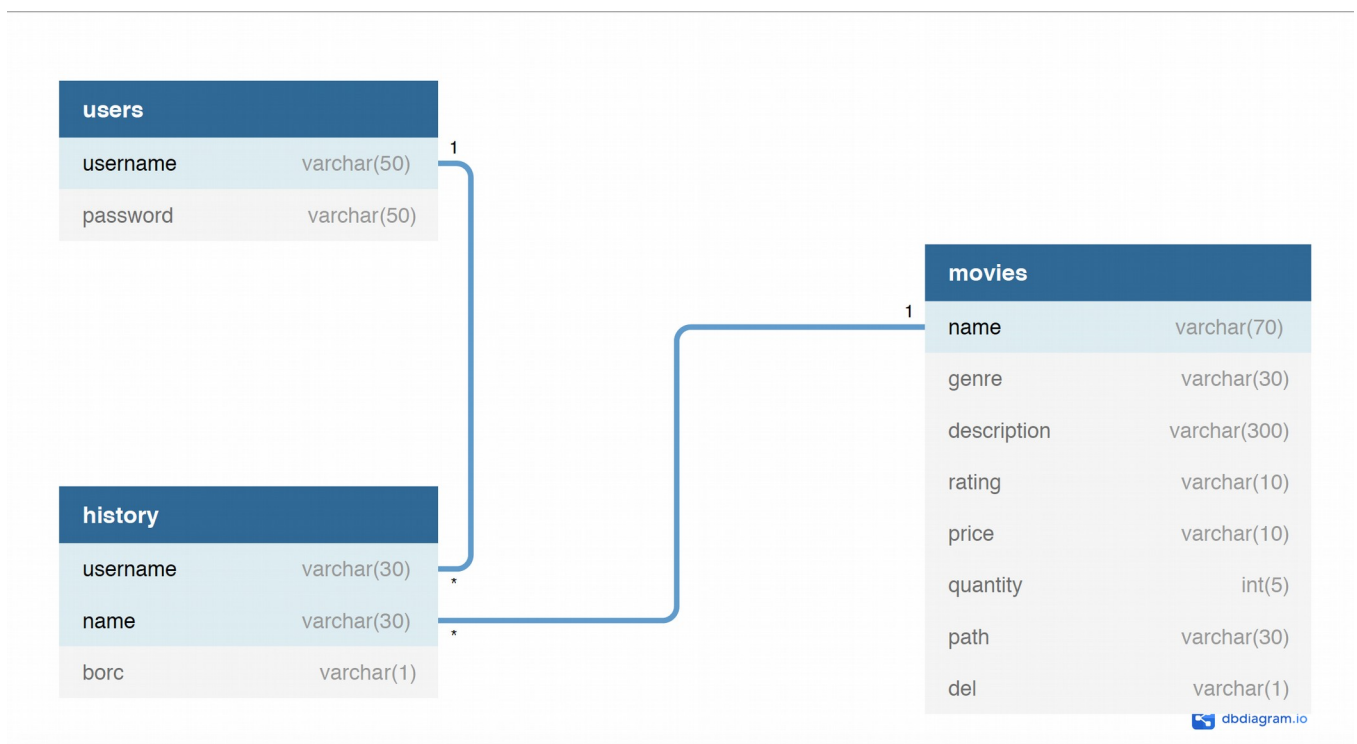

Search and filter all the available movies, see a detail description of every movie along with the images, add movies to cart, and to check out and see the past purchase history.

Additionally, it also allows the admin user to: Insert New Movies, Update Movies, Remove Movies (Soft Delete) and look at the Inventory of all the Movies, along with the normal user functionalities.

Assumptions made:

- Email address is the username and should contain '@email.com'.
- The password should be more than 7 characters in length and should contain letters, numbers and special characters.
- Since this is a movie store, a user only needs to purchase one copy. However, the total quantity is tracked in the database.
- User must add movies to cart before checking out.
- The user can individually checkout items from cart as it gives them more flexibility.
- The paths start with `http://localhost/moviestore/`. The ports need to be manually included in certain computers.
- Admin username is admin@email.com

Database Design:

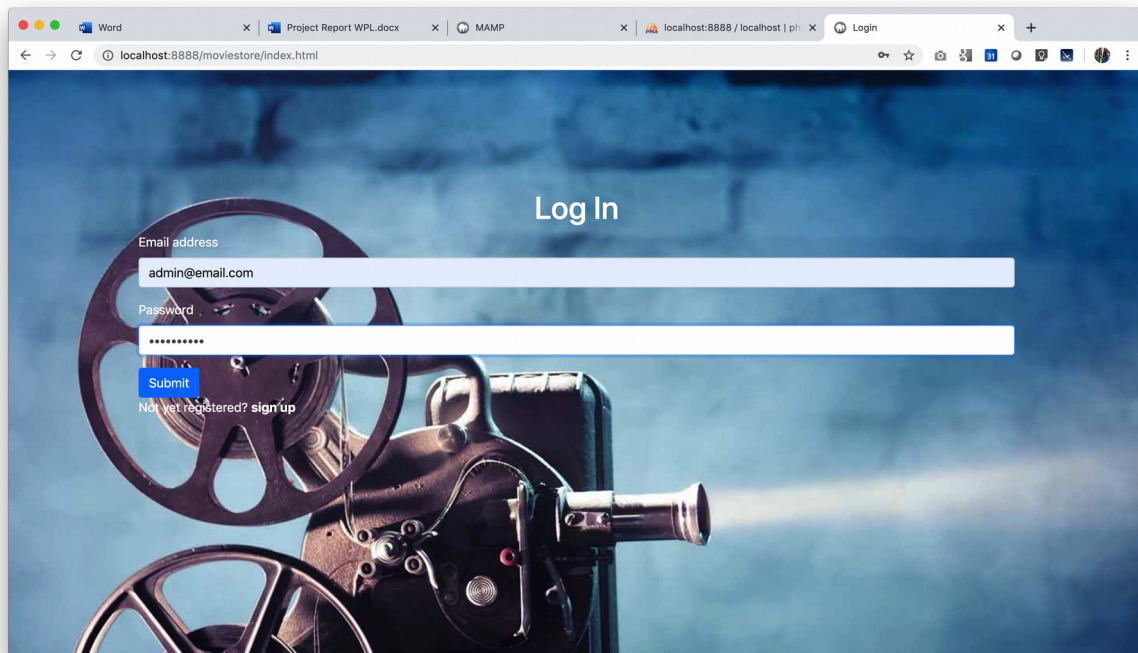

Languages/frameworks:

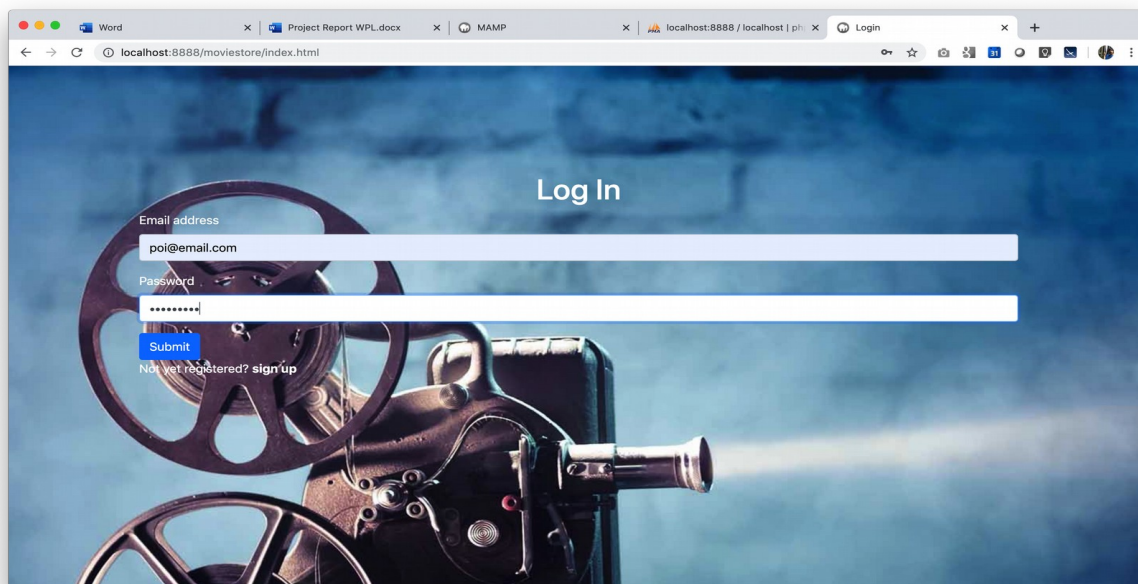

PHP, Javascript, Bootstrap, JQuery, HTML, CSS.
